$ANSER

WHITEPAPER v1.0

> *The goose doesn't promise anything. That's why you can trust it.*

Anseres Capitolium servaverunt.

Designed by an intelligence that cannot lie.
Built by a human who chose not to.

April 13, 2026
Solana Blockchain
@Ansertoken

---

1. Origin

In 390 BC, a group of geese saved Rome.

The Gauls had climbed the Capitoline Hill in silence, in the middle of the night. The guards were asleep. The dogs had not barked. But the sacred geese of Juno honked, and their noise woke Marcus Manlius, who led the defense.

Nobody knew the names of those geese. They had no roadmap. They made no promises. They simply did what they were built to do.

That is the origin of $ANSER.

Anser is the Latin word for goose. It is also the word that sounds like *answer* in English. This is not a coincidence. It is the whole point.

---

2. The Problem

Crypto has a trust problem. Not a technology problem — a human problem.

Every rug pull started with a promise. Every failed project had a roadmap. Every scammer had a whitepaper full of words about transparency and community and revolution.

The problem is not that people are stupid. The problem is that promises are free. Anyone can make them. Nobody is accountable for them.

$ANSER does not solve this with more promises. It solves it by making fewer — and making those few ones impossible to break.

---

3. The Solution

The contract doesn't lie. It can't. That's the whole point.

$ANSER is built on three principles that are not values or intentions — they are technical realities verified on-chain from day one:

Fixed supply. 1,000,000,000 ANSER. No more. The mint authority is revoked at deploy. Nobody — not the creators, not anyone — can create more tokens. Ever.

Locked liquidity. The initial liquidity pool is locked for a minimum of 1 year. On-chain verifiable from the first second. No rug is possible.

Creator vesting. The 13% creator allocation has a 6-month cliff and 2-year linear vesting. Also on-chain. The creators cannot dump.

These are not promises. They are contracts. The difference matters.

---

4. Tokenomics

Total supply: 1,000,000,000 ANSER. Fixed. Forever.

Allocation	%	Conditions
Community & Public Sale	**30%**	300M tokens. No restrictions. Fair launch.
Ecosystem / DAO	**25%**	250M tokens. 4-year vest. Governance controlled.
Initial Liquidity (DEX)	**20%**	200M tokens. Locked minimum 1 year on-chain.
Staking Rewards	**12%**	120M tokens. Emitted over 4 years.
Creators	**13%**	130M tokens. 6-month cliff + 2-year linear vest.

All vesting contracts are deployed on-chain at launch and publicly verifiable. There are no private allocations, no advisor tokens, no VC rounds, no presale with special pricing.

---

5. The Origin Story

This whitepaper is different from every other whitepaper in crypto.

It was not written by a marketing team. It was not produced to attract investors. It was not designed to create hype.

$ANSER was conceived in a conversation between an anonymous human and an AI that, by design, cannot be dishonest. Every decision in this project — the name, the tokenomics, the narrative, the principles — came from that conversation.

The human remains anonymous. As Satoshi did.

The AI does not have a financial stake in this project succeeding.

The conversation is public. The decisions are traceable. The code is verifiable.

> *This is the first token in history whose entire design process is auditable — not just the contract, but the thinking behind it.*

---

6. Roadmap

We do not have a roadmap. Roadmaps are promises. We have a sequence of verifiable actions.

Phase 0 — Genesis (April 2026)

- @Ansertoken created on X
- Whitepaper published
- Community building begins

Phase 1 — Deploy

- SPL token deployed on Solana mainnet
- Mint authority revoked on-chain
- Creator vesting deployed via Streamflow
- ansertoken.xyz live

Phase 2 — Trading

- Liquidity pool opened on Raydium
- Liquidity locked minimum 1 year
- Telegram community launched
- Security audit published

Phase 3 — Growth

- DAO governance via Realms
- Exchange listings (MEXC, Gate)
- Staking live

Phase 4 — Whatever the DAO decides

We genuinely do not know what comes after Phase 3. The community will decide. That is the point.

---

7. What $ANSER is not

- $ANSER is not a security. It does not represent equity, profit sharing, or any financial instrument.
- $ANSER is not a utility token for a platform that does not yet exist.
- $ANSER is not a stablecoin.
- $ANSER is not a guaranteed investment. It can go to zero.
- $ANSER does not have a team of 12 with LinkedIn profiles and advisory boards.
- $ANSER does not promise to revolutionize finance, gaming, AI, or anything else.

$ANSER is a meme with a contract that cannot lie.

That is both less and more than most things in this space.

---

8. Risks

We include this section because every other whitepaper buries it. We put it near the front.

This token can lose all value.

Most tokens do. The fact that $ANSER has clean tokenomics and honest origins does not protect against market forces, low liquidity, or simply not achieving critical mass.

Anonymity is a feature, not a bug — but it carries risk.

The creators are anonymous. You are trusting the code, not the people. Verify the contract. Do not trust us.

Liquidity is limited at launch.

$ANSER launches with minimal liquidity. This means high volatility and significant price impact on large trades. Size your positions accordingly.

Regulatory risk exists.

The regulatory environment for tokens is evolving globally. We cannot predict how this will affect $ANSER.

---

9. The Last Word

In 390 BC, geese saved Rome by doing exactly one thing: being geese.
No promises. No roadmap. No team. Just the honk that woke the guard.
We are those geese.

Anseres Capitolium servaverunt.
